This invention describes novel plant N-acetylglucosaminyl transferase I (GnTI) proteins and their encoding nucleic acids. The nucleic acid sequences of the invention may be used for recombinant production of the encoded proteins, which are then used to raise antibodies (Ab) for the may also be used to detect such plants by hybridization and to isolate related sequences from other plants by hybridization and to isolate related sequences from other plants by typerdization and to sense constructs for reducing/deleting GnTI protein activity in plants. These transgenic plants may be used to produce glycoproteins with minimal, uniform and defined sugar residues. Such glycoproteins are useful in medicine and research, e.g. human glucocerebrosidase for treating Gaucher's disease. Plants which are defective or deficient in the contract of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   production of the GnTI protein can be made to produce glycoproteins with minimal, uniform and defined sugar residues, of low antigenicity. Use of these plants eliminates the need for the difficult isolation and deglycoslyation of native proteins or preparation in defective animal cells. This sequence represents cDNA which encodes an Arabidopsis thaliana GnTI homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding plant N-acetylglucosaminyl transferase I useful for generating plants producing glycosylated proteins of low

Rabbit liver GnT I was purified and digested with pepsin, then trypsin. The peptide fragments were sequenced and used to design degenerate PCR primers (see AAG)0220-5). CDNA was prepared from total RNA from rabbit liver. PCR was carried out on the CDNA preparation. One of the two PCR products was cloned into the Smal site of pGEM72 for sequencing and then used as a riboprobe. The riboprobe was used to screen a rabbit liver CDNA library in lambda gtl0. The largest insert in a positive clone was 1.6kb. An 80bp riboprobe was prepared from the 5'-terminal of the 1.6kb insert and used to rescreen the library. The largest CDNA insert was cloned into pGEM-7z to obtain pGEM-7z-regnil. The full-length rabbit GnT is coding sequence was eventually obtained from overlapping clones.
                                                                                                                                                                                                                                                                                                                                            - for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            402

Preparation of maltose-binding protein-N-acetylglucosaminyltransferase for use in sugar chain synthesis, comprises using Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the preparation of a maltose-binding protein (MBP)-N-acetylglucosaminyltransferase (GnT) fused protein. The method comprises transforming Escherichia coli with an expression vector encoding the fusion protein. GnT antibody is useful in sugar chain synthesis and in a plasmid pNAL-c2/EcoR1.Xbal fragment to give a new plasmid pMGNT-1. The present sequence encodes human GnT.
                                                                                                                                                                            SS

```
A rabbit GnT I cDNA probe was prepared using PCR on rabbit liver CDNA. The probe was used to screen an amplified human genomic DNA library in lambda BNBL3 prepared from chromosomal DNA of chronic myeloid leukaemia cells. The coding sequence was located in a 4.0kb fragment of human genomic DNA by screening with a probe containing the entire coding region of the rabbit GnT i cDNA. The fragment was sequenced and found to contain an ORF coding for a protein of 445 amino acids (2 less than the rabbit enzyme). The similarity between the human and rabbit enzyme is 85%.
                                                                                                                                                                                                                                           ï

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;

This invention relates to nucleic acid sequences AAF93744 - AAF93916
which encode human secretory or membrane proteins represented by
AAB88419. Included in the invention are primers
CC AAB88419. Included in the invention are primers
CC AAF93917 - AAF64295 and AAF62212 - AAF62235 which are used to isolate the
CC CDNA sequences of the invention. The invention also includes methods for
CC the production of artibodies directed against the proteins, and CDNA
CS sequences, which can be used in veccines. The polynucleotide sequences
CC can be used in gene therapy. The polynucleotide sequences and the
CC proteins they encode may be used in the prevention, treatment and
Cd aganosis of diseases associated with inappropriate secretory
CC protein/membrane protein expression. The nucleic acids and complementary
CC sequences may also be used as DNA probes in diagnostic assays
CC e-g. polymerase chain reactions (PCR)) to detect and quantitate the
CC presence of similar nucleic acid sequences in samples. They may also be
used to study the expression and function of secretory proteins/membrane
CD sucked to study the expression of metabolism. The polymeptides may be used
as antigens in the production of antibodies against them and in assays to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins, useful in

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insecticides, theractions in higher eukaryotes for the development of discloses genomic DNA sequences (ABL16176-ABL16175) and pharmaceutical drugs. The invention sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                             Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                               Drosophila melanogaster genomic polynucleotide SEQ ID NO 19549.

```
The present invention relates to immunogenic portions of new human breast tumour antigens (AAB28183-B28214) and their coding sequences (AAC69645-C69804). The breast tumour antigen polypeptides of the present invention and their coding sequences are useful for inhibiting the development of breast cancer in a patient. The breast tumour antigen polypeptides and polymucleotides may be used in vaccines and pharmaceutical compositions for treating breast cancer, and for diagnosing and monitoring the cancer. The present sequence is a coding sequence for the immunogenic portion for one such human breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTCCCTGTGGTGCGTCTCGGCCTGGAATGACAACGGCAAGGAGCAGATG 311

The present invention describes primer sets for synthesising 5602

[11] Inaught cDNAs defined in the specification. Where a primer set

[12] Comprises: (a) an oligo-dT primer and an oligonucleotide complementary

[23] Comprises: (a) an oligo-dT primer and an oligonucleotide complementary

[24] Complementary strand of a polynucleotide which comprises one of

[25] Complementary strand of a polynucleotides or (b) a combination

[26] Oligonucleotide comprising a sequence complementary to the

[27] Complementary strand of a polynucleotide which comprises a 5'-end

[28] Sequence and an oligonucleotide comprising a sequence complementary to the

[27] Complementary strand of a polynucleotide which comprises a 5'-end

[28] Sequence 3'-end sequence 3'-end sequence, where the

[28] Coligonucleotide which comprises at least 15 nucleotides and the combination of

[29] Coligonucleotide which comprises as a least 15 nucleotides and the complementary

[29] Coligonucleotide which comprises at least 15 nucleotides and the complementary

[20] Coligonucleotide which comprises at least 15 nucleotides and the sequence in a general primer set useful for synthesising polynucleotides,

[20] Coligonucleotide of the primer set also useful for the

[20] Coligonucleotide of the primers are also useful for the

[21] Coligonucleotides of the abnormality of the proteins encoded by

[22] Charas easily without any specialised methods. AAH33629 and

[23] AAH3633 to AAH13632 to AAH13632

[24] Coligonucleotides, all of which are used in the exemplification

[25] Coligonucleotides, all of which are used in the exemplification
                                                                                                                          Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Yamamoto J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Saito K,

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, limmunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypucleotide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,
                                                                                                                                                                                                                                                                                                                                                                                                        Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptides, useful for treating disorders system injuries -

CE-mail:tasaskienas.affrc.305-8602, Japan

(E-mail:tasaskienas.affrc.30-38-38-7468)

The nucleotide sequence of this BAC clone was generated by combining Monsanto and RGP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a "working draft' sequence.

* NOTE: This is a "working draft' sequence.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* The accession number will be preserved.

* The accession number will be preserved.
